Logic Pro MIDI routing guide for Temperance Pro

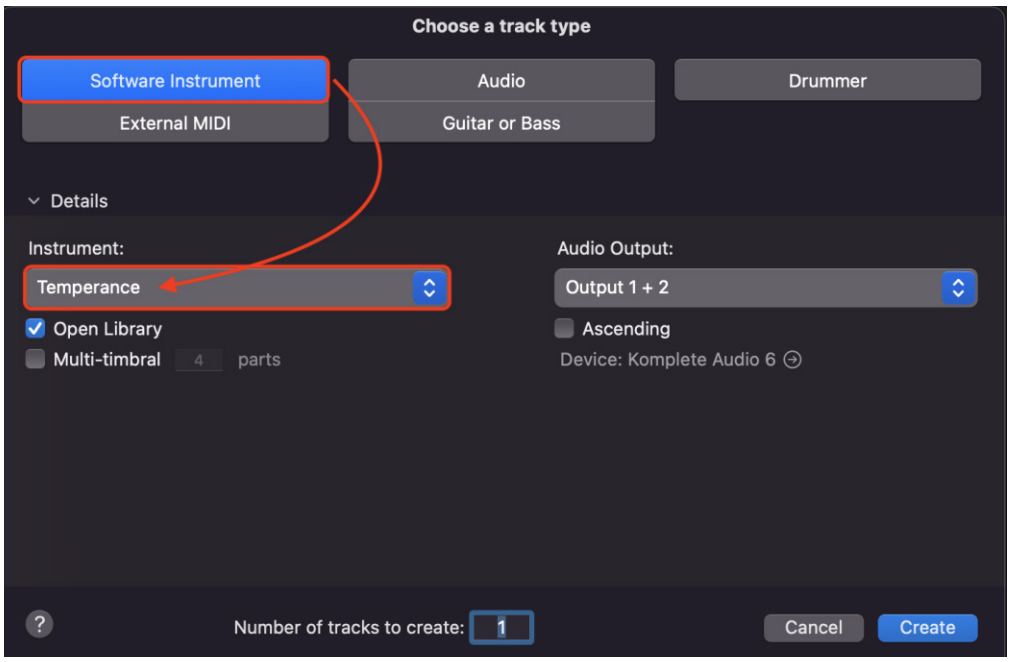

Overview

MIDI note information can't be routed to a standard audio track in Logic. To route MIDI into Temperance Pro, you'll need to create an instrument track to host the plugin insert and feed it into the desired audio via sidechain.

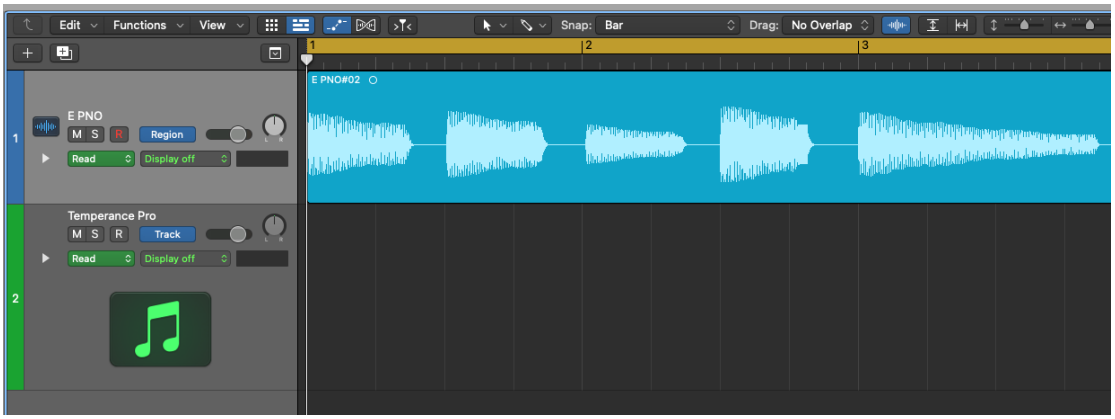

Step 1. Add new track from the Track Menu

Step 2. Create a Software Instrument track and select "Temperance Pro" from the AU MIDI-Controlled Effects category

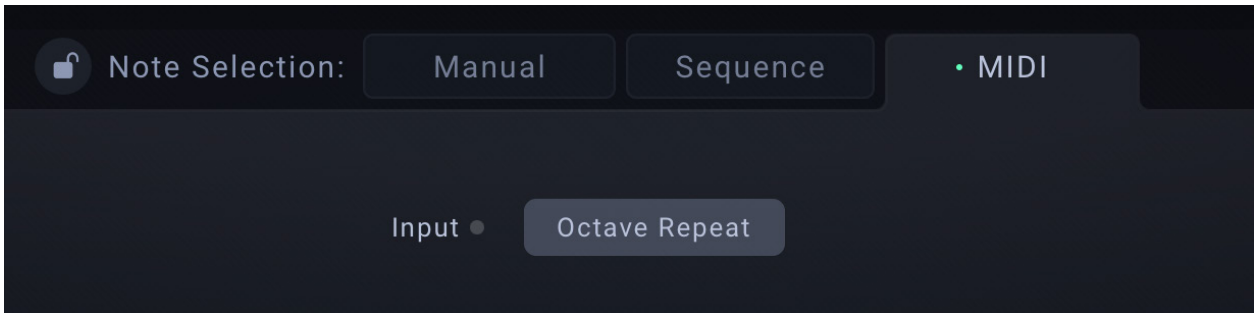

Step 3. Locate the audio track you want routed through Temperance Pro in conjunction with MIDI

Step 4: Select Temperance Pro's sidechain input for the desired audio track or bus in the plugin window header. The input should be audible through Temperance Pro on playback after this step

Step 5. Select MIDI mode and set a positive Temper value to hear MIDI notes imparted in the reverb

Step 6. The original audio track may be muted and audio will still play through the Temperance Pro track. Perform or place MIDI on the Temperance track to emphasize or de-emphasize notes in the reverb
